Preface

uses to be both a fine editor and a terrific human being. May his sense of humor never fail him.

It is hard for us to imagine how people co-authored projects before the existence of the Internet. The ability to send formatted text back and forth (again and again) has meant that for very large parts of this manuscript, it is no longer possible for us to be sure who wrote which sentences, or originated or developed which ideas. The result, we believe, is genuine synergy; neither of us could have done this alone, and despite the occasional rough patch, we had a wonderful time doing it together.

Our families, Doug, Daniel, and Matthew and Larry, Melissa, and Laura, have suffered long and not always silently, but have hung in there nonetheless. We dedicate this book to our husbands, Larry Wright and Douglas Johnson, both longtime activists beyond borders, and thank them for what they have taught us about connection.

Chapter 1

Transnational Advocacy Networks in International Politics: Introduction

World politics at the end of the twentieth century involves, alongside states, many nonstate actors that interact with each other, with states, and with international organizations. These interactions are structured in terms of networks, and transnational networks are increasingly visible in international politics. Some involve economic actors and firms. Some are networks of scientists and experts whose professional ties and shared causal ideas underpin their efforts to influence policy. Others are networks of activists, distinguishable largely by the centrality of principled ideas or values in motivating their formation. We will call these transnational advocacy networks.

Advocacy networks are significant transnationally and domestically. By building new links among actors in civil societies, states, and international organizations, they multiply the channels of access to the international system. In such issue areas as the environment and human rights, they also make international resources available to new actors in domestic political and social struggles. By thus blurring the boundaries between a state’s relations with its own nationals and the recourse both citizens

2 Ideas that specify criteria for determining whether actions are right and wrong and whether outcomes are just or unjust are shared principled beliefs or values. Beliefs about cause-effect relationships are shared causal beliefs. Judith Goldstein and Robert Keohane, eds., Ideas and Foreign Policy: Beliefs, Institutions, and Political Change (Ithaca: Cornell University Press, 1993), pp. 8–10.
and states have to the international system, advocacy networks are helping to transform the practice of national sovereignty.

To explore these issues, we first look at four historical forerunners to modern advocacy networks, including the antislavery movement and the campaign for woman suffrage, and we examine in depth three contemporary cases in which transnational organizations are very prominent: human rights, environment, and women's rights. We also refer to transnational campaigns around indigenous rights, labor rights, and infant formula. Despite their differences, these networks are similar in several important respects: the centrality of values or principled ideas, the belief that individuals can make a difference, the creative use of information, and the employment by nongovernmental actors of sophisticated political strategies in targeting their campaigns.

Scholars have been slow to recognize either the rationality or the significance of activist networks. Motivated by values rather than by material concerns or professional norms, these networks fall outside our accustomed categories. More than other kinds of transnational actors, advocacy networks often reach beyond policy change to advocate and instigate changes in the institutional and principled basis of international interactions. When they succeed, they are an important part of an explanation for changes in world politics. A transnational advocacy network includes those relevant actors working internationally on an issue, who are bound together by shared values, a common discourse, and dense exchanges of information and services. Such networks are most prevalent in areas characterized by high value content and informational uncertainty. At the core of the relationship is information exchange. What is novel in these networks is the ability of nontraditional international actors to mobilize information strategically to help create new issues and categories and to persuade, pressure, and gain leverage over much more powerful organizations and governments. Activists in networks try not only to influence policy outcomes, but to transform the terms and nature of the debate. They are not always successful in their efforts, but they are increasingly relevant players in policy debates.

Transnational advocacy networks are proliferating, and their goal is to change the behavior of states and of international organizations. Simultaneously principled and strategic actors, they "frame" issues to make them comprehensible to target audiences, to attract attention and encourage action, and to "fit" with favorable institutional venues. Network actors bring new ideas, norms, and discourses into policy debates, and serve as sources of information and testimony. Norms, here, follows the usage given by Peter Katzenstein,

"to describe collective expectations for the proper behavior of actors with a given identity. In some situations norms operate like rules that define the identity of an actor, thus having "constitutive effects" that specify what actions will cause relevant others to recognize a particular identity."

They also promote norm implementation, by pressuring target actors to adopt new policies, and by monitoring compliance with international standards. Insofar as is possible, they seek to maximize their influence or leverage over the target of their actions. In doing so they contribute to changing perceptions that both state and societal actors may have of their identities, interests, and preferences, to transforming their discursive positions, and ultimately to changing procedures, policies, and behavior.

Networks are communicative structures. To influence discourse, procedures, and policy, activists may engage and become part of larger policy communities that group actors working on an issue from a variety of institutional and value perspectives. Transnational advocacy networks must also be understood as political spaces, in which differently situated actors negotiate—formally or informally—the social, cultural, and political meanings of their joint enterprise.

---

Activists beyond Borders

We refer to transnational networks (rather than coalitions, movements, or civil society) to evoke the structured and structuring dimension in the actions of these complex agents, who not only participate in new areas of politics but also shape them. By importing the network concept from sociology and applying it transnationally, we bridge the increasingly artificial divide between international and national realms. Still, social science theories did not dictate our choice of “network” as the name to be given to the phenomena we are studying. The actors themselves did: over the last two decades, individuals and organizations have consciously formed and named transnational networks, developed and shared networking strategies and techniques, and assessed the advantages and limits of this kind of activity. Scholars have come late to the party.

Given our enterprise, it should be clear that we reject the separation common in our discipline between international relations and comparative politics. Moreover, even liberal theories of international relations that recognize that domestic interests shape states’ actions internationally, and that states are embedded in an interdependent world where nonstate actors are consequential, cannot explain the phenomena we describe.7 Robert Putnam’s “two-level game” metaphor has taken liberal theorists some distance toward seeing international relations as a two-way street, in which political entrepreneurs bring international influence to bear on domestic politics at the same time that domestic politics shapes their international positions.8 But however valuable its insights, even this two-way street is too narrow, implying a limited access to the international system that no longer holds true in many issue areas.

Instead, we draw upon sociological traditions that focus on complex interactions among actors, on the intersubjective construction of frames of meaning, and on the negotiation and malleability of identities and interests. These have been concerns of constructivists in international relations theory and of social movement theorists in comparative politics, and we draw from both traditions. The networks we describe in this book participate in domestic and international politics simultaneously, drawing upon a variety of resources, as if they were part of an international society. However, they use these resources strategically to affect a world of states and international organizations constructed by states. Both these dimensions are essential. Rationalists will recognize the language of incentives and constraints, strategies, institutions, and rules, whereas con-

7 For an impressive effort to systematize liberal international relations theory, see Andrew Moravcsik, “Liberalism and International Relations Theory,” Harvard University Center for International Affairs, Working Paper no. 92-6, revised April 1993. Liberal institutionalists since Robert O. Keohane and Joseph S. Nye, Power and Interdependence: World Politics in Transition (Boston: Little, Brown, 1977), have taken complex interdependence as axiomatic in the development of regime theory.

Introduction

Structuralists and social constructionists will be more comfortable with our stress on norms, social relations, and intersubjective understandings. We are convinced that both sets of concerns matter, and that recognizing that goals and interests are not exogenously given, we can think about the strategic activity of actors in an intersubjectively structured political universe. The key to doing so is remembering that the social and political contexts within which networks operate at any particular point contain contested understandings as well as stable and shared ones. Network activists can operate strategically within the more stable universe of shared understandings at the same time that they try to reshape certain contested meanings.

Part of what is so elusive about networks is how they seem to embody elements of agent and structure simultaneously. When we ask who creates networks and how, we are inquiring about them as structures—as patterns of interactions among organizations and individuals. When we talk about them as actors, however, we are attributing to these structures an agency that is not reducible to the agency of their components. Nonetheless, when we sometimes refer to networks as actors in this book, we do not lose sight of the fact that activists act on behalf of networks.

Our approach to these transnational interactions must therefore be both structural and actor-centered. We address four main questions: (1) What is a transnational advocacy network? (2) Why and how do they emerge? (3) How do advocacy networks work? (4) Under what conditions can they be effective—that is, when are they most likely to achieve their goals?

When we started this book, the realm of transnational social movements and networks was still an almost uncharted area of scholarship, both theoretically and empirically, and thus required a style of research aimed at the discovery of new theory and patterns. Because few existing theories attempt to explain the transnational phenomena we are studying, we could not rely on standard social science methods for hypothesis testing. Social scientists recognize that generating theory and formulating hypotheses require different methods from those for testing theory. Our approach thus resembles what sociologists call “grounded theory,” which is the most systematic attempt to specify how theoretical insights are generated through qualitative research.9 While doing the research for

this book, we first explored these new patterns of interaction inductively, by studying the histories of particular networks involved in transnational campaigns. Because cross-national and cross-cultural activism are intensely context-sensitive, we cast a wide net in our search for intervening variables between values and advocacy and between advocacy and its (apparent) effect. Nevertheless, looking comparatively across regions and issue areas, we found striking commonalities in how and why networks emerged, and in the strategies they adopted. Although we eventually found that the theoretical work on domestic social movements has a great deal to say about how transnational advocacy networks function, we did not begin with this assumption. Out of our observed commonalities we generated some initial arguments about why networks emerge and under what conditions they can be effective. In the tradition of grounded theory, we used additional comparative cases to further explore and refine our initial arguments. In each of our cases we refer to issues where networks exist and where networks do not exist, and we explore both successful and unsuccessful networks and campaigns.

International and domestic nongovernmental organizations (NGOs) play a prominent role in these networks, in some cases inspired by an international voluntarism that is largely unaccounted for in international relations theory. Social scientists have barely addressed the political role of activist NGOs as simultaneously domestic and international actors. Much of the existing literature on NGOs comes from development studies, and either ignores interactions with states or is remarkably thin on political analysis. Examining their role in advocacy networks helps both to distinguish NGOs from, and to see their connections with, social movements, state agencies, and international organizations.

We examine transnational advocacy networks and what they do by analyzing campaigns networks have waged. For our purposes, campaigns are sets of strategically linked activities in which members of a diffuse principled network (what social movement theorists would call a "mobilization potential") develop explicit, visible ties and mutually recognized roles in pursuit of a common goal (and generally against a common target). In a campaign, core network actors mobilize others and initiate the tasks of structural integration and cultural negotiation among the groups in the network. Just as in domestic campaigns, they connect groups to each other, seek out resources, propose and prepare activities, and conduct public relations. They must also consciously seek to develop a "common frame of meaning"—a task complicated by cultural diversity within transnational networks. Activist groups have long used the language of campaigning to talk about focused, strategically planned efforts. International campaigns by environmental and conservation organizations, for example, have traditionally had a topical focus (saving furry animals, whales, tropical forests), whereas human rights campaigns have focused on either a country (the Argentine campaign) or an issue (torture).

Analysis of campaigns provides a window on transnational relations as an arena of struggle in ways that a focus on networks themselves or on the institutions they try to affect does not. In most chapters we also consider noncampaigns—issues that activists identified as problematic, but around which networks did not campaign. This focus on campaigns highlights relationships—how connections are established and maintained among network actors, and between activists and their allies and opponents. We can identify the kinds of resources that make a campaign possible, such as information, leadership, and symbolic or material capital. And we must consider the kinds of institutional structures, both domestic and international, that encourage or impede particular kinds of transnational activism. Here we draw from several traditions. Thomas Risse-Kappen's recent work argues that domestic structures mediate transnational interactions. By domestic structures he means state structure (centralized vs. fragmented), societal structure (weak vs. strong), and policy networks (consensual vs. polarized). Similarly, social movement theorists agree that understanding the political context or "opportunity structure" is key both to understanding a movement's emergence and to gauging its success. Assessing opportunity structure can be an exercise in comparative statics—looking at differential access by citizens to political institutions like legislatures, bureaucracies, and courts—or it can be viewed dynamically, as in changes in formal or informal political power relations over time. We agree with Sidney Tarrow on the need to combine the more narrowly institutional version

---

with a dynamic approach. Finally, a focus on campaigning lets us explore negotiation of meaning while we look at the evolution of tactics; we can recognize that cultural differences, different conceptions of the stakes in a campaign, and resource inequalities among network actors exist, at the same time that we identify critical roles that different actors fill. Campaigns are processes of issue construction constrained by the action context in which they are to be carried out: activists identify a problem, specify a cause, and propose a solution, all with an eye toward producing procedural, substantive, and normative change in their area of concern. In networked campaigns this process of “strategic portrayal” must work for the different actors in the network and also for target audiences.

**What Is a Transnational Advocacy Network?**

Networks are forms of organization characterized by voluntary, reciprocal, and horizontal patterns of communication and exchange. The organizational theorist Walter Powell calls them a third mode of economic organization, distinctly different from markets and hierarchy (the firm). “Networks are ‘lighter on their feet’ than hierarchy” and are “particularly apt for circumstances in which there is a need for efficient, reliable information,” and “for the exchange of commodities whose value is not easily measured.” His insights about economic networks are extraordinarily suggestive for an understanding of political networks, which also form around issues where information plays a key role, and around issues where the value of the “commodity” is not easily measured.

In spite of the differences between domestic and international realms, the network concept travels well because it stresses fluid and open relations among committed and knowledgeable actors working in specialized issue areas. We call them advocacy networks because advocates pool the causes of others or defend a cause or proposition. Advocacy captures what is unique about these transnational networks: they are organized to promote causes, principled ideas, and norms, and they often involve individuals advocating policy changes that cannot be easily linked to a rationalist understanding of their “interests.”

Some issue areas reproduce transnationally the webs of personal relationships that are crucial in the formation of domestic networks. Advocacy networks have been particularly important in value-laden debates over human rights, the environment, women, infant health, and indigenous peoples, where large numbers of differently situated individuals have become acquainted over a considerable period and developed similar world views. When the more visionary among them have proposed strategies for political action around apparently intractable problems, this potential has been transformed into an action network.

Major actors in advocacy networks may include the following: (1) international and domestic nongovernmental research and advocacy organizations; (2) local social movements; (3) foundations; (4) the media; (5) churches, trade unions, consumer organizations, and intellectuals; (6) parts of regional and international intergovernmental organizations; and (7) parts of the executive and/or parliamentary branches of governments. Not all these will be present in each advocacy network. Initial research suggests, however, that international and domestic NGOs play a central role in all advocacy networks, usually initiating actions and pressuring more powerful actors to take positions. NGOs introduce new ideas, provide information, and lobby for policy changes.

Groups in a network share values and frequently exchange information and services. The flow of information among actors in the network is dense web of connections among these groups, both formal and informal. The movement of funds and services is especially notable between foundations and NGOs, and some NGOs provide services such as training for other NGOs in the same and sometimes other advocacy networks. Personnel also circulate within and among networks, as relevant players move from one to another in a version of the “revolving door.”

Relationships among networks, both within and between issue areas, are similar to what scholars of social movements have found for domestic activism. Individuals and foundation funding have moved back and forth among them. Environmentalists and women’s groups have looked at the history of human rights campaigns for models of effective international institution building. Refugee resettlement and indigenous people’s rights are increasingly central components of international environmental
activity, and vice versa; mainstream human rights organizations have joined the campaign for women’s rights. Some activists consider themselves part of an “NGO community.”

Besides sharing information, groups in networks create categories or frames within which to generate and organize information on which to base their campaigns. Their ability to generate information quickly and accurately, and deploy it effectively, is their most valuable currency; it is also central to their identity. Core campaign organizers must ensure that individuals and organizations with access to necessary information are incorporated into the network; different ways of framing an issue may require quite different kinds of information. Thus frame disputes can be a significant source of change within networks.

**Why and How Have Transnational Advocacy Networks Emerged?**

Advocacy networks are not new. We can find examples as far back as the nineteenth-century campaign for the abolition of slavery. But their number, size, and professionalism, and the speed, density, and complexity of international linkages among them has grown dramatically in the last three decades. As Hugh Heclo remarks about domestic issue networks, “if the current situation is a mere outgrowth of old tendencies, it is so in the same sense that a 16-lane spaghetti interchange is the mere elaboration of a country crossroads.”

We cannot accurately count transnational advocacy networks to measure their growth over time, but one proxy is the increase in the number of international NGOs committed to social change. Because international NGOs are key components of any advocacy network, this increase suggests broader trends in the number, size, and density of advocacy networks generally. Table 1 suggests that the number of international nongovernmental social change groups has increased across all issues, though to varying degrees in different issue areas. There are five times as many organizations working primarily on human rights as there were in 1980, but proportionally human rights groups have remained roughly a quarter of all such groups. Similarly, groups working on women’s rights accounted for 9 percent of all groups in 1985 and in 1993. Transnational environmental organizations have grown most dramatically in absolute and relative terms, increasing from two groups in 1985 to ninety in 1993, and from 1.8 percent of total groups in 1985 to 14.3 percent in 1993. The

---

around which the largest number of international nongovernmental social change organizations has organized. Together, groups working on human rights, environment, and women’s rights account for over half the total number of international nongovernmental social change organizations.

International networking is costly. Geographic distance, the influence of nationalism, the multiplicity of languages and cultures, and the costs of fax, phone, mail, and air travel make the proliferation of international networks a puzzle that needs explanation. Under what conditions are networks possible and likely, and what triggers their emergence?

Transnational advocacy networks appear most likely to emerge around those issues where (1) channels between domestic groups and their governments are blocked or hampered or where such channels are ineffective for resolving a conflict, setting into motion the “boomerang” pattern of influence characteristic of these networks (see Figure 1); (2) activists or “political entrepreneurs” believe that networking will further their missions and campaigns, and actively promote networks; and (3) conferences and other forms of international contact create arenas for forming and strengthening networks. Where channels of participation are blocked, the international arena may be the only means that domestic activists have to gain attention to their issues. Boomerang strategies are most common in campaigns where the target is a state’s domestic policies or behavior; where a campaign seeks broad procedural change involving dispersed actors, strategies are more diffuse.

The Boomerang Pattern

It is no accident that so many advocacy networks address claims about rights in their campaigns. Governments are the primary “guarantors” of rights, but also their primary violators. When a government violates or refuses to recognize rights, individuals and domestic groups often have no recourse within domestic political or judicial arenas. They may seek international connections finally to express their concerns and even to protect their lives.

When channels between the state and its domestic actors are blocked, the boomerang pattern of influence characteristic of transnational networks may occur: domestic NGOs bypass their state and directly search out international allies to try to bring pressure on their states from outside. This is most obviously the case in human rights campaigns. Similarly, indigenous rights campaigns and environmental campaigns that support the demands of local peoples for participation in development projects that would affect them frequently involve this kind of triangulation. Linkages are important for both sides: for the less powerful third world actors, networks provide access, leverage, and information (and

Activists beyond Borders

Political Entrepreneurs

Just as oppression and injustice do not themselves produce movements or revolutions, claims around issues amenable to international action do not produce transnational networks. Activists — "people who care enough about some issue that they are prepared to incur significant costs and act to achieve their goals" — do. They create them when they believe that transnational networking will further their organizational mis-
sions — by sharing information, attaining greater visibility, gaining access to wider publics, multiplying channels of institutional access, and so forth. For example, in the campaign to stop the promotion of infant formula to poor women in developing countries, organizers settled on a boycott of Nestlé, the largest producer, as its main tactic. Because Nestlé was a transnational actor, activists believed a transnational network was necessary to bring pressure on corporations and governments. Over time, in such issue areas, participation in transnational networks has become an essential component of the collective identities of the activists involved, and networking a part of their common repertoire. The political entrepreneurs who become the core networkers for a new campaign have often gained experience in earlier ones.

The Growth of International Contact

Opportunities for network activities have increased over the last two decades. In addition to the efforts of pioneers, a proliferation of international organizations and conferences has provided for connections. Cheaper air travel and new electronic communication technologies speed information flows and simplify personal contact among activists. Underlying these trends is a broader cultural shift. The new networks have depended on the creation of a new kind of global public (or civil society), which grew as a cultural legacy of the 1960s. Both the activism that swept Western Europe, the United States, and many parts of the third world during that decade, and the vastly increased opportunities for international contact, contributed to this shift. With a significant decline in air fares, foreign travel ceased to be the exclusive privilege of the

26 The constant dollar yield of airline tickets in 1995 was one half of what it was in 1975, while the number of international passengers increased more than four times during the same period. Air Transport Association home page, June 1997, http://www.airs.org/traffic.htm. See James Rosenau, Turbulence in World Politics (Princeton: Princeton University Press, 1990), pp. 12, 25.

wealthy. Students participated in exchange programs. The Peace Corps and lay missionary programs sent thousands of young people to live and work in the developing world. Political exiles from Latin America taught in U.S. and European universities. Churches opened their doors to refugees, and to new ideas and commitments.

Obviously, internationalism was not invented in the sixties. Religious and political traditions including missionary outreach, the solidarity traditions of labor and the left, and liberal internationalism have long stirred action by individuals or groups beyond the borders of their own state. While many activists working in advocacy networks come out of these traditions, they tend no longer to define themselves in terms of these traditions or the organizations that carried them. This is most true for activists on the left who suffered disillusionment from their groups' refusal to address seriously the concerns of women, the environment, or human rights violations in eastern bloc countries. Absent a range of options that in earlier decades would have competed for their commitments, advocacy and activism through either NGOs or grassroots movements became the most likely alternative for those seeking to "make a difference."

Although numerous solidarity committees and human rights groups campaigned against torture and disappearances under Latin American military regimes, even on behalf of the same individuals they employed different styles, strategies, and discourses, and understood their goals in the light of different principles. Solidarity organizations based their appeals on common ideological commitments — the notion that those being tortured or killed were defending a cause shared with the activists. Rights organizations, in principle, were committed to defending the rights of individuals regardless of their ideological affinity with the ideas of the victim. One exception to this ideal involved the use of violence. Amnesty International, for example, defended all prisoners against torture, summary execution, or the death penalty, but it would adopt as its more visible and symbolic "prisoners of conscience" only those individuals who had not advocated violence. Although labor internationalism has survived the decline of the left, it is based mainly on large membership organizations representing (however imperfectly) bounded constituencies. Where advocacy networks have formed around labor issues, they have been transitory, responding to repression of domestic labor movements (as in labor support networks formed around Brazil, South Africa, and Central America in the early 1980s).
Advocacy networks in the north function in a cultural milieu of internationalism that is generally optimistic about the promise and possibilities of international networking. For network members in developing countries, however, justifying external intervention or pressure in domestic affairs is a much trickier business, except when lives are at stake. Linkages with northern networks require high levels of trust, as arguments justifying intervention on ethical grounds confront the ingrained nationalistic common to many political groups in the developing world, as well as memories of colonial and neocolonial relations.

**How Do Transnational Advocacy Networks Work?**

Transnational advocacy networks seek influence in many of the same ways that other political groups or social movements do. Since they are not powerful in a traditional sense of the word, they must use the power of their information, ideas, and strategies to alter the information and value contexts within which states make policies. The bulk of what networks do might be termed persuasion or socialization, but neither process is devoid of conflict. Persuasion and socialization often involve not just reasoning with opponents, but also bringing pressure, arm-twisting, encouraging sanctions, and shaming. Audie Klotz’s work on norms and apartheid discusses coercion, incentive, and legitimation effects that are often part of a socialization process.

Our typology of tactics that networks use in their efforts at persuasion, socialization, and pressure includes (1) information politics, or the ability to quickly and credibly generate politically usable information and move it to where it will have the most impact; (2) symbolic politics, or the ability to call upon symbols, actions, or stories that make sense of a situation for an audience that is frequently far away; (3) leverage politics, or the ability to call upon powerful actors to affect a situation where weaker members of a network are unlikely to have influence; and (4) accountability politics, or the effort to hold powerful actors to their previously stated policies or principles.

A single campaign may contain many of these elements simultaneously. For example, the human rights network disseminated information about human rights abuses in Argentina in the period 1976-83. The

Activists beyond Borders

This decision came in part from interaction with an emerging global human rights network. We argue that this represents not the victory of morality over self-interest, but a transformed understanding of national interest, possible in part because of structured interactions between state components and networks. This changing understanding cannot be derived solely from changing global and economic conditions, although these are relevant. Transnational networks normally involve a small number of activists from the organizations and institutions involved in a given campaign or advocacy role. The kinds of pressure and agenda politics in which advocacy networks engage rarely involve mass mobilization, except at key moments, although the peoples whose cause they espouse may engage in mass protest (for example, those ousted from their land in the Narmada dam case). \textsuperscript{30} Boycott strategies are a partial exception. Instead of mass mobilization, network activists engage in what Baumgartner and Jones, borrowing from law, call "venue shopping," which relies "more on the dual strategy of the presentation of an image and the search for a more receptive political venue." \textsuperscript{31} The recent coupling of indigenous rights and environmental issues is a good example of a strategic venue shift by indigenous activists, who found the environmental arena more receptive to their claims than human rights venues had been.

Information Politics

Information binds network members together and is essential for network effectiveness. Many information exchanges are informal—telephone calls, E-mail and fax communications, and the circulation of newsletters, pamphlets and bulletins. They provide information that would not otherwise be available, from sources that might not otherwise be heard, and they must make this information comprehensible and useful to activists and publics who may be geographically and/or socially distant. \textsuperscript{32}

\textsuperscript{30} Gerhards and Rueck. "Mesomobilization," details the organizational efforts to prepare demonstration and parallel meetings to coincide with the 1998 meeting of the World Bank and International Monetary Fund in Berlin. This was by far the largest mass action in conjunction with the multilateral development bank campaign, which began holding meetings and demonstrations parallel to the banks' annual meetings in 1986. Interestingly, the authors seem not to have been aware of the existence of a transnational campaign of which this action was a part. On Narmada, see Medha Patkar, "The Struggle for Participation and Justice: A Historical Narrative," pp. 177–202; Anil Patel, "What Do the Narmada Tribals Want?" pp. 179–202; and Lori Udall, "The International Narmada Campaign: A Case of Sustained Advocacy," pp. 203–30. In Toward Sustainable Development? ed. Fisher.

\textsuperscript{31} Baumgartner and Jones, "Agenda Dynamics," 1950.

\textsuperscript{32} Rosensius, Tarbarchance, p. 199, argues that "as the adequacy of information and the very nature of knowledge have emerged as central issues, what were once regarded as the petty quarrels of scholars over the adequacy of evidence and the metaphysics of proof have become prominent activities in international relations."

Introduction

Nonstate actors gain influence by serving as alternate sources of information. Information flows in advocacy networks provide not only facts but testimony—stories told by people whose lives have been affected. Moreover, activists interpret facts and testimony, usually framing issues simply, in terms of right and wrong, because their purpose is to persuade people and stimulate them to act. How does this process of persuasion occur? An effective frame must show that a given state of affairs is neither natural nor accidental, identify the responsible party or parties, and propose credible solutions. These aims require clear, powerful messages that appeal to shared principles, which often have more impact on state policy than advice of technical experts. An important part of the political struggle over information is precisely whether an issue is defined primarily as technical—and thus subject to consideration by "qualified" experts—or as something that concerns a broader global constituency.

Even as we highlight the importance of testimony, however, we have to recognize the mediations involved. The process by which testimony is discovered and presented normally involves several layers of prior translation. Transnational actors may identify what kinds of testimony would be valuable, then ask an NGO in the area to seek out people who could tell those stories. They may filter the testimony through expatriates, through traveling scholars like ourselves, or through the media. There is frequently a huge gap between the story's original telling and the retellings—in its sociocultural context, its instrumental meaning, and even in its language. Local people, in other words, sometimes lose control over their stories in a transnational campaign. How this process of mediation/translation occurs is a particularly interesting facet of network politics. \textsuperscript{33}

Networks strive to uncover and investigate problems, and alert the press and policymakers. One activist described this as the "human rights methodology"—"promoting change by reporting facts." \textsuperscript{34} To be credible, the information produced by networks must be reliable and well documented. To gain attention, the information must be timely and dramatic. Sometimes these multiple goals of information politics conflict, but both credibility and drama seem to be essential components of a strategy aimed at persuading publics and policymakers to change their minds. The notion of "reporting facts" does not fully express the way networks strategically use information to frame issues. Networks call attention to issues, or even create issues by using language that dramatizes

\textsuperscript{33} We are grateful to Anna Lowenhaupt Tsing for this point.

activists beyond borders

and draws attention to their concerns. A good example is the recent campaign against the practice of female genital mutilation. Before 1976, the widespread practice of female circumcision in many African and a few Asian and Middle Eastern countries was known outside these regions mainly among medical experts and anthropologists. A controversial campaign, initiated in 1974 by a network of women’s and human rights organizations, began to draw wider attention to the issues by renaming the problem. Previously the practice was referred to by technically “neutral” terms such as female circumcision, clitoridectomy, or infibulation. The campaign around female genital “mutilation” raised its salience, literally creating the issue as a matter of public international concern. By renaming the practice the network broke the link to male circumcision (seen as a personal medical or cultural decision), implied a link with the more feared procedure of castration, and reframed the issue as one of violence against women. It thus resituated the practice as a human rights violation. The campaign generated action in many countries, including France and the United Kingdom, and the UN studied the problem and made a series of recommendations for eradicating certain traditional practices.

Uncertainty is one of the most frequently cited dimensions of environmental issues. Not only is hard information scarce (although this is changing), but any given data may be open to a variety of interpretations. The tropical forest issue is fraught with scientific uncertainty about the role of forests in climate regulation, the regenerative value of undiscovered or untapped biological resources. Environmentalists are unlikely to resolve these questions, and what they have done in some recent campaigns is reframe the issue, calling attention to the impact of deforestation on particular human populations. By doing so, they called for action independent of the scientific data. Human rights activists, baby food campaigners, and women’s groups play similar roles, dramatizing the situations of the victims and turning the cold facts into human stories, intended to move people to action. The baby food campaign, for example, relied heavily on public health studies that proved that improper bottle feeding contributed to infant malnutrition and mortality, and that corporate sales promotion was leading to a decline in breast feeding. Network activists repackage and interpreted this information in dramatic ways designed to promote action: the British development organization War on Want published a pamphlet entitled “The Baby Killers,” which the Swiss Third World Action Group translated into German and retitled “Nestlé Kills Babies.” Nestlé inadvertently gave activists a prominent public forum when it sued the Third World Action Group for defamation and libel.

Nongovernmental networks have helped legitimize the use of testimonial information along with technical and statistical information. Linkage of the two is crucial, for without the individual cases activists cannot motivate people to seek changed policies. Increasingly, international campaigns by networks take this two-level approach to information. In the 1980s even Greenpeace, which initially had eschewed rigorous research in favor of splashy media events, began to pay more attention to getting the facts right. Both technical information and dramatic testimony help to make the need for action more real for ordinary citizens.

A dense web of north-south exchange, aided by computer and fax communication, means that governments can no longer monopolize information flows as they could a mere half-decade ago. These technologies have had an enormous impact on moving information to and from third world countries, where mail service has often been slow and precarious; they also give special advantages of course, to organizations that have access to them. A good example of the new informational role of networks occurred when U.S. environmentalists pressured President George Bush to raise the issue of gold miners’ ongoing invasions of the Yanomami indigenous reserve when Brazilian president Fernando Collor de Mello was in Washington in 1991. Collor believed that he had squelched protest over the Yanomami question by creating major media events out of the dynamiting of airstrips used by gold miners, but network members had current information faxed from Brazil, and they countered his claims with evidence that miners had rebuilt the airstrips and were still invading the Yanomami area.

The central role of information in these issues helps explain the drive to create networks. Information in these issue areas is both essential and dispersed. Nongovernmental actors depend on their access to information to help make them legitimate players. Contact with like-minded groups at home and abroad provides access to information necessary to their work.
Activists beyond Borders

broadens their legitimacy, and helps to mobilize information around particular policy targets. Most nongovernmental organizations cannot afford to maintain staff people in a variety of countries. In exceptional cases they send staff members on investigation missions, but this is not practical for keeping informed on routine developments. Forging links with local organizations allows groups to receive and monitor information from many countries at a lower cost. Local groups, in turn, depend on international contacts to get their information out and to help protect them in their work.

The media is an essential partner in network information politics. To reach a broader audience, networks strive to attract press attention. Sympathetic journalists may become part of the network, but more often network activists cultivate a reputation for credibility with the press, and package their information in a timely and dramatic way to draw press attention.43

Symbolic Politics

Activists frame issues by identifying and providing convincing explanations for powerful symbolic events, which in turn become catalysts for the growth of networks. Symbolic interpretation is part of the process of persuasion by which networks create awareness and expand their constituencies. Awarding the 1992 Nobel Peace Prize to Maya activist Rigoberta Menchú and the UN’s designation of 1993 as the Year of Indigenous Peoples heightened public awareness of the situation of indigenous peoples in the Americas. Indigenous people’s use of 1992, the 500th anniversary of the voyage of Columbus to the Americas, to raise a host of issues well illustrates the use of symbolic events to reshape understandings.44

The 1973 coup in Chile played this kind of catalytic role for the human rights community. Because Chile was the symbol of democracy in Latin America, the fact that such a brutal coup could happen there suggested that it could happen anywhere. For activists in the United States, the role of their government in undermining the Allende government intensified the need to take action. Often it is not one event but the juxtaposition of disparate events that makes people change their minds and act. For many people in the United States it was the juxtaposition of the coup in Chile, the war in Vietnam, Watergate, and the Civil Rights Movement that gave birth to the human rights movement. Likewise, dramatic footage of the Brazilian rainforest burning during the hot summer of 1988 in the

United States may have convinced many people that global warming and tropical deforestation were serious and linked issues. The assassination of Brazilian rubber tapper leader Chico Mendes at the end of that year crystallized the belief that something was profoundly wrong in the Amazon.

Leverage Politics

Activists in advocacy networks are concerned with political effectiveness. Their definition of effectiveness often includes some policy change by “target actors” such as governments, international financial institutions like the World Bank, or private actors like transnational corporations. In order to bring about policy change, networks need to pressure and persuade more powerful actors. To gain influence the networks seek leverage (the word appears often in the discourse of advocacy organizations) over more powerful actors. By leveraging more powerful institutions, weak groups can influence far beyond their ability to influence state practices directly. The identification of material or moral leverage is a crucial strategic step in network campaigns.

Material leverage usually links the issue to money or goods (but potentially also to votes in international organizations, prestigious offices, or other benefits). The human rights issue became negotiable because governments or financial institutions connected human rights practices to military and economic aid, or to bilateral diplomatic relations. In the United States, human rights groups got leverage by providing policymakers with information that convinced them to cut off military and economic aid. To make the issue negotiable, NGOs first had to raise its profile or salience, using information and symbolic politics. Then more powerful members of the network had to link cooperation to something else of value: money, trade, or prestige. Similarly, in the environmentalists’ multilateral development bank campaign, linkage of environmental protection with access to loans was very powerful.

Although NGO influence often depends on securing powerful allies, their credibility still depends in part on their ability to mobilize their own members and affect public opinion via the media. In democracies the potential to influence votes gives large membership organizations an advantage over nonmember organizations in lobbying for policy change; environmental organizations, several of whose memberships number in the millions, are more likely to have this added clout than are human rights organizations.

Moral leverage involves what some commentators have called the “mobilization of shame,” where the behavior of target actors is held up to the light of international scrutiny. Network activists exert moral leverage on the assumption that governments value the good opinion of others;
insofar as networks can demonstrate that a state is violating international obligations or is not living up to its own claims, they hope to jeopardize its credit enough to motivate a change in policy or behavior. The degree to which states are vulnerable to this kind of pressure varies, and will be discussed further below.

Accountability Politics

Networks devote considerable energy to convincing governments and other actors to publicly change their positions on issues. This is often dismissed as inconsequential change, since talk is cheap and governments sometimes change discursive positions hoping to divert network and public attention. Network activists, however, try to make such statements into opportunities for accountability politics. Once a government has publicly committed itself to a principle—for example, in favor of human rights or democracy—networks can use those positions, and their command of information, to expose the distance between discourse and practice. This is embarrassing to many governments, which may try to save face by closing that distance.

Perhaps the best example of network accountability politics was the ability of the human rights network to use the human rights provisions of the 1975 Helsinki Accords to pressure the Soviet Union and the governments of Eastern Europe for change. The Helsinki Accords helped revive the human rights movement in the Soviet Union, spawned new organizations like the Moscow Helsinki Group and the Helsinki Watch Committee in the United States, and helped protect activists from repression. The human rights network referred to Moscow’s obligations under the Helsinki Final Act and juxtaposed these with examples of abuses. In an illustration of the boomerang effect, human rights activist Yuri Orlov said, “We do not have the means to reach our government. My appeal to Brezhnev probably got as far as the regional KGB office... The crucial question is what means are there for a Soviet citizen to approach his own government, other than indirectly through the governments of other countries.”

Domestic structures through which states and private actors can be held accountable to their pronouncements, to the law, or to contracts vary considerably from one nation to another, even among democracies. The centrality of the courts in U.S. politics creates a venue for the representation of diffuse interests that is not available in most European democracies. It also explains the large number of U.S. advocacy organizations that specialize in litigation. The existence of legal mechanisms does not necessarily make them possible instruments, however; Brazil has had a diffuse interests law granting standing to environmental and consumer advocacy organizations since 1985, but the sluggishness of Brazil’s judiciary makes it largely ineffective.

Under What Conditions Do Advocacy Networks Have Influence?

To assess the influence of advocacy networks we must look at goal achievement at several different levels. We identify the following types or stages of network influence: (1) issue creation and agenda setting; (2) influence on discursive positions of states and international organizations; (3) influence on institutional procedures; (4) influence on policy change in “target actors” which may be states, international organizations like the World Bank, or private actors like the Nestle Corporation; and (5) influence on state behavior.

Networks generate attention to new issues and help set agendas when they provoke media attention, debates, hearings, and meetings on issues that previously had not been a matter of public debate. Because values are the essence of advocacy networks, this stage of influence may require a modification of the “value context” in which policy debates takes place. The UN’s theme years and decades, such as International Women’s Decade and the Year of Indigenous Peoples, were international events promoted by networks that heightened awareness of issues.

Networks influence discursive positions when they help persuade states and international organizations to support international declarations or to change stated domestic policy positions. The role environmental networks played in shaping state positions and conference declarations at the 1992 “Earth Summit” in Rio de Janeiro is an example of this kind of impact. They may also pressure states to make more binding commitments by signing conventions and codes of conduct.

The targets of network campaigns frequently respond to demands for policy change with changes in procedures (which may affect policies in the future). The multilateral bank campaign, discussed in Chapter 4, is largely responsible for a number of changes in internal bank directives mandating greater NGO and local participation in discussions of projects. It also opened access to formerly restricted information, and led to the establishment of an independent inspection panel for World Bank Operations.
projects. Procedural changes can greatly increase the opportunity for advocacy organizations to develop regular contact with other key players on an issue, and they sometimes offer the opportunity to move from outside to inside pressure strategies. A network's activities may produce changes in policies, not only of the target states, but also of other states and/or international institutions. Explicit policy shifts seem to denote success, but even here both their causes and meanings may be elusive. We can point with some confidence to network impact where human rights network pressures have achieved cutoffs of military aid to repressive regimes, or a curtailment of repressive practices. Sometimes human rights activity even affects regime stability. But we must take care to distinguish between policy change and change in behavior; official policies regarding timber extraction in Sarawak, Malaysia, for example, may say little about how timber companies behave on the ground in the absence of enforcement.

We speak of stages of impact, and not merely types of impact, because we believe that increased attention, followed by changes in discursive positions, make governments more vulnerable to the claims that networks raise. Discursive changes can also have a powerfully divisive effect on networks themselves, splitting insiders from outsiders, reformers from radicals. A government that claims to be protecting indigenous areas or ecological reserves is potentially more vulnerable to charges that such areas are endangered than one that makes no such claim. At that point the effort is not to make governments change their position but to hold them to their word. Meaningful policy change is thus more likely when the first three types of impact have occurred.

Both issue characteristics and actor characteristics are important parts of our explanation of how networks affect political outcomes and the conditions under which networks can be effective. Issue characteristics such as salience and resonance within existing national or institutional agendas can tell us something about where networks are likely to be able to insert new ideas and discourses into policy debates. Success in influencing policy also depends on the strength and density of the network and its ability to achieve leverage. Although many issue and actor characteristics are relevant here, we stress issue resonance, network density, and target vulnerability.

Issue Characteristics

Issues that involve ideas about right and wrong are amenable to advocacy networking because they arouse strong feelings, allow networks to recruit volunteers and activists, and infuse meaning into these volunteer activities. However, not all principled ideas lead to network formation, and some issues can be framed more easily than others so as to resonate with policymakers and publics. In particular, problems whose causes can be assigned to the deliberate (intentional) actions of identifiable individuals are amenable to advocacy network strategies in ways that problems whose causes are irredeemably structural are not. The real creativity of advocacy networks has been in finding intentional frames within which to address some elements of structural problems. Though the frame of violence against women does not exhaust the structural issue of patriarchy, it may transform some of patriarchy's effects into problems amenable to solution. Reframing land use and tenure conflict as environmental issues does not exhaust the problems of poverty and inequality, but it may improve the odds against solving part of them. Network actors argue that in such reframing they are weakening the structural apparatus of patriarchy, poverty, and inequality and empowering new actors to address these problems better in the future. Whether or not they are right, with the decline almost everywhere of mass parties of the left, few alternative agendas remain on the table within which these issues can be addressed.

As we look at the issues around which transnational advocacy networks have organized most effectively, we find two issue characteristics that appear most frequently: (1) issues involving bodily harm to vulnerable individuals, especially when there is a short and clear causal chain (or story) assigning responsibility; and (2) issues involving legal equality of opportunity. The first respond to a normative logic, and the second to a juridical and institutional one.

Issues involving physical harm to vulnerable or innocent individuals appear particularly compelling. Of course, what constitutes bodily harm and who is vulnerable or innocent may be highly contested. As the early failed campaign against female circumcision shows, one person's harm is another's rite of passage. Still, campaigns against practices involving bodily harm to populations perceived as vulnerable or innocent are most likely to be effective transnationally. Torture and disappearance have been more tractable than some other human rights issues, and protesting torture of political prisoners more effective than protesting torture of common criminals or capital punishment. Environmental campaigns that have had the greatest transnational effect have stressed the connection between protecting environments and protecting the often vulnerable people who live in them.

We also argue that in order to campaign on an issue it must be converted into a "causal story" that establishes who bears responsibility or guilt. But the causal chain needs to be sufficiently short and clear to make the case convincing. The responsibility of a torturer who places an electric prod to a prisoner's genitals is quite clear. Assigning blame to state leaders for the actions of soldiers or prison guards involves a longer
Activists beyond Borders

causal chain, but accords with common notions of the principle of strict chain of command in military regimes.

Activists have been able to convince people that the World Bank bears responsibility for the human and environmental impact of projects it directly funds, but have had a harder time convincingly making the International Monetary Fund (IMF) responsible for hunger or food riots in the developing world. In the latter case the causal chain is longer, more complex, and much less visible, since neither the IMF nor governments reveal the exact content of negotiations.

An example from the Nestlé Boycott helps to illustrate the point about causal chains. The boycott was successful in ending direct advertising and promotion of infant formula to mothers because activists could establish that the corporation directly influenced decisions about infant feeding, with negative effects on infant health. But the boycott failed to prevent corporations from donating infant formula supplies to hospitals. Although this was the single most successful marketing tool of the corporation, the campaign’s longer and more complex story about responsibility failed here because publics believe that doctors and hospitals buffer patients from corporate influence.

The second issue around which transnational campaigns appear to be effective is increased legal equality of opportunity (as distinguished from outcome). Our discussions of slavery and woman suffrage in Chapter 2 address this issue characteristic, as does one of the most successful transnational campaigns we don’t discuss—the antiapartheid campaign.

What made apartheid such a clear target was the legal denial of the most basic aspects of equality of opportunity. Places where racial stratification is almost as severe as it is in South Africa, but where such stratification is not legally mandated, such as Brazil and some U.S. cities, have not generated the same concern.30

Actors Characteristics

However amenable particular issues may be to strong transnational and transcultural messages, there must be actors capable of transmitting those messages and targets who are vulnerable to persuasion or leverage. Networks operate best when they are dense, with many actors, strong connections among groups in the network, and reliable information flows. (Density refers both to regularity and diffusion of information exchange within networks and to coverage of key areas.) Effective networks must involve reciprocal information exchanges, and include activists from target countries as well as those able to get institutional

leverage. Measuring network density is problematic; sufficient densities are likely to be campaign-specific, and not only numbers of “nodes” in the network but also their quality—access to and ability to disseminate information, credibility with targets, ability to speak to and for other social networks—are all important aspects of density as well.

Target actors must be vulnerable either to material incentives or to sanctions from outside actors, or they must be sensitive to pressure because of gaps between stated commitments and practice. Vulnerability arises both from the availability of leverage and the target’s sensitivity to leverage; if either is missing, a campaign may fail. Countries that are most susceptible to network pressures are those that aspire to belong to a normative community of nations. This desire implies a view of state preferences that recognizes states’ interactions as a social—and socializing—process.51 Thus moral leverage may be especially relevant where states are actively trying to raise their status in the international system. Brazilian governments since 1986, for example, have been very concerned about the impact of the Amazon issue on Brazil’s international image. President José Sarney’s invitation to hold the 1992 United Nations Conference on Environment and Development in Brazil was an attempt to improve that image. Similarly, the concern of recent Mexican administrations with Mexico’s international prestige has made it more vulnerable to pressure from the human rights network. In the baby food campaign, network activists used moral leverage to convince states to vote in favor of the WHO/UNICEF codes of conduct. As a result, even the Netherlands and Switzerland, both major exporters of infant formula, voted in favor of the code.

Thinking about Transnational Politics

By focusing on international interactions involving nonstate actors, we follow in the tradition of earlier work in transnational politics that signaled the emergence of multiple channels of contact among societies, and the resultant blurring of domestic and international politics.52 The network concept offers a further refinement of that work. Both the Keohane and Nye collection and the various analysts of the “new transnationalism” lump together relations among quite distinct kinds of transnational actors: multinational corporations, the Catholic church, international scientific organizations, and activist groups.53 All

51 See Finnemore, National Interests in International Society.

53 See Finnemore, National Interests in International Society.

The only factor that many of these transnational relations share is that all operate across national borders, and all are characterized by purposeful actors (at least one of which is a nonstate agent). See Rose-Kappen, "Introduction," Bringing Transnational Relations Back In, p. 8.
these relations can be characterized as forms of transnational net-
works, but we distinguish three different categories based on their mo-
tivations: (1) those with essentially instrumental goals, especially
transnational corporations and banks; (2) those motivated primarily by
shared causal ideas, such as scientific groups or epistemic communi-
ties; and (3) those motivated primarily by shared principled ideas or val-
tues (transnational advocacy networks).

These different categories of transnational networks correspond to differ-
ent endowments of political resources and patterns of influence. In transna-
tional relations among actors with instrumental goals, we would expect
economic resources to carry the most weight; in epistemic communities,
technical expertise and the ability to convince policymakers of its impor-
tance counts most. Like epistemic communities, transnational advocacy net-
woks rely on information, but for them it is the interpretation and strategic
use of information that is most important. Influence is possible because the
actors in these networks are simultaneously helping to define the issue area
itself, convince target audiences that the problems thus defined are solvable,
provide solutions, and monitor their implementation. Thus transnational
advocacy networks are distinctive in the centrality of principled ideas; their
strategies aim to use information and beliefs to motivate political action and
to use leverage to gain the support of more powerful institutions.

Without assuming that political interactions in the international sys-
tem are reducible to domestic politics writ large, we have drawn exten-
sively on insights developed in studies of domestic politics. American
political science has been crucially attentive to theories of group for-
mation and behavior. However, both pluralist and elitist theories clas-
sify issue areas narrowly either by economic sector or by government
policy clusters.58 By extending the use of issue area to principled issues

56 See Haas, ed., Knowledge, Power, and International Policy Coordination. Theorists of epistemic
communities exclude activist groups from their definition, seeing epistemic communi-
ties mainly as groups of scientists, limited to more technical issues in international relations.
M. J. Peterson, in "Whakas, Geographies of the Knowledgeable, and the International Man-
agement of Whailing," International Organization 46 (Winter 1992), pp. 129, 135, distinguishes actors in
epistemic communities from activists, who are "not constrained by conventionalists, and
who frame issues in simple terms, dividing the world into "bad guys" and "good guys."

57 Andrew S. McFauland, "Interest Groups and Political Time: Cycles in America," British
Journal of Political Science 21 (July 1991) 261. Attempts to characterize patterns of influence
have included explanations highlighting group characteristics, issue characteristics, and
more recently, patterns of interaction—policy committees and issue networks. See, e.g.,
Medico, "Issue Networks"; Jack Haywood, "The Policy Community Approach to Industrial
Policy," in Comparative Political Dynamics: Global Research Perspectives, ed. Dankwart Rustow
Aldrich and David A. Whetten, "Organizational Decision-Set Conceptualizations," in
"Organizational Decision-Set Conceptualizations," in Handbook of Organizational Design, ed. Paul Nystrom and William
Starbuck (New York: Oxford University Press, 1981). This organizational decision-sets has occa-
sionally been applied to international relations. See Gay D. Ness and Steven R. Brechin,
"Bridging the Gap: International Organizations as Organizations," International Organization
42 (Spring 1988), 245-73.

58 Methodologies and software for analyzing networks are discussed in David Komro and
James H. Keikins, Network Analysis, Sage university papers series; Quantitative applications
in the social sciences, no. 28 (Beverly Hills and London: Sage, 1984). It is unclear whether the
high investment of time and money of using these methodologies to analyze more far-flung
international networks can be justified by the theoretical payoffs generated. Although net-
work sampling is possible, "no completely satisfactory strategy currently exists" (p. 27).

59 Stephen Brooks, "Introduction: Policy Communities and the Social Sciences," in The Polit-
ical Influence of Ideas, ed. Stephen Brooks and Alain-G. Cagnon (Newport, Conn.: Prager, 1994).

as well, we are rejecting an economically reductionist notion of inter-
ests, adopting instead a more interactive approach to how interests are
shaped within networks. The network literature in sociology has de-
volved formal mechanisms for identifying and mapping networks,
and exploring their attributes and relations—such as the network’s
density or the strength of links within it.56

As the notion of a policy community as a patterned interaction
within an issue area gained currency, it led to greater interaction with
European social scientists, who thought most interest group theory
was too closely patterned on U.S. politics. Europeans brought to
the debate a concern with group boundaries and relations among mem-
bers, and with ideas and the intellectuals who frame and spread them.
This focus dovetailed with a growing interest, inspired by the work of
John Kingdon, in the dynamics of the public agenda.57 Research on
public interest advocacy groups and citizens groups blur the bound-
aries between social movement and interest group theories. Public
interest advocacy groups "live on controversy" and are created by
political entrepreneurs and supported by private foundations. Like our
own, this work highlights the interactive context in which political
claims are conceived and negotiated.58

Similar concerns have become important in studies of social move-
ments over the last decade. Organizations and individuals within advoca-
cy networks are political entrepreneurs who mobilize resources like
information and membership and show a sophisticated awareness of the
political opportunity structures within which they are operating.59 Our
stress on the role of values in networks is consistent with some arguments

53 See, inter alia, David A. Snow, Louis A. Zurcher, and Sheldon Ekland-Olson, "Social Net-
worked and Social Movements: A Microstructural Approach to Differential Recruitment,"
American Sociological Review 45 (1980), 787-802; Snow et al., "Frame Alignment Processes;
Snow and Benford, "Ideology, Frame Resonance, and Participant Mobilization;" Sidney Tarrow,
Power in Movement: Social Movements, Collective Action, and Mass Politics in the Modern State
(Cambridge: Cambridge University Press, 1994); and McDermott, McCarthy, and Zald, "Intro-
duction," in Comparative Perspectives on Social Movements, pp. 1-20.
contained in the literature on "new social movements." Most important, however, over the last decade social movement theory has increasingly focused on the interaction between social structural conditions and action, on the social context of mobilization, and on the transformation of meanings among activists and among mass publics that make people believe they can have an impact on an issue.

As cognitive and relational aspects of these theoretical approaches have come to the fore, their potential utility for studying transnational group activities becomes much greater. By disaggregating national states into components—sometimes competing—parts that interact differently with different kinds of groups, we gain a much more multidimensional view of how groups and individuals enter the political arena. Focusing on interactive contexts lets us explore the roles of values, ideas, and different kinds of information and knowledge. As Heclo argues, "network members reinforce each other’s sense of issues as their interests, rather than (as standard political or economic models would have it) interests defining positions on issues." These theoretical approaches travel well from domestic to transnational relations precisely because to do so, they do not have to travel at all. Instead, many transnational actors have simply thrown off the fiction of the unitary state as seen from outside.62

**Toward a Global Civil Society?**

Many other scholars now recognize that "the state does not monopolize the public sphere,"63 and are seeking, as we are, ways to describe the sphere of international interactions under a variety of names: transnational relations, international civil society, and global civil society.64 In these views, states no longer look unitary from the outside. Increasingly

---

62 Douglas Chalmers takes this idea the furthest, arguing that many of these international actors should now be viewed simply as "internationalized domestic actors," and their international resources as political resources like any other. See "Internationalized Domestic Politics in Latin America: The Institutional Role of Internationally Based Actors," unpublished paper, Columbia University, 1993.
Activists beyond Borders

about the way in which certain groups emerge and are legitimized (by governments, institutions, and other groups)."^^

PRINCIPLES, NORMS, AND PRACTICES

In his classic work The Anarchical Society, Hedley Bull made no bones about the fact that in talking about international society he was talking about a society of states. Such a society of states exists, he believed, "when a group of states, conscious of certain common interests and common values, form a society in the sense that they conceive themselves to be bound by a common set of rules in their relations with one another, and share in the working of common institutions."^^ Bull resisted the notion of an international society made up of individuals, believing that developments in that direction (the Nuremberg and Tokyo war crimes tribunals and the Universal Declaration of Human Rights) added confusion to the international scene, in that "there is no agreement as to the relative importance of these different kinds of legal and moral agents, or on any general scheme of rules that would relate them one to another."^^ Bull would have recognized the advocacy networks we discuss in this book as contributors to such uncertainty. However, he also believed in the existence of a set of basic values without which international society was inconceivable—consisting in the protection of life and bodily integrity, observance of agreements, and reasonable consistency of property relations. Understanding the importance of the actors and/or the rules of interaction among them requires attention to the place of values or norms in theorizing about relations.

Interpretivist theories have highlighted the independent role of norms in international relations, and have seen identities, norms, and interests as mutually constitutive. Norms constrain because they are embedded in social structures that partially demarcate valued communities. Nevertheless, systemic explanations need to be grounded in process tracing if they are to show the mechanisms by which norms constrain. That

^^ Ibid., p. 37.

means, to see norms in action we have to examine the actions of individuals and groups in historical contexts. Norms and practices are mutually constitutive—norms have power in, and because of, what people do.

We use the term "practice" here not only as "that which is done," but as "the act of doing something repeatedly." This allows us to consider the intensity of norms as well as normative change. Playing music requires practice—so much practice that in the end hands can move without the conscious mediation of thought telling them where to go. Similarly, we can imagine norms whose practice over time has become so automatic that they gain a taken-for-granted quality, in which practices and standards become so routinized as to be taken almost as laws of nature. Normative change is inherently disruptive or difficult because it requires actors to question this routinized practice and contemplate new practices.^^

What distinguishes principled activists of the kind we discuss in this volume is the intensely self-conscious and self-reflective nature of their normative awareness. No more automatic "reactors," these are people who seek to amplify the generative power of norms, broaden the scope of practices those norms engender, and sometimes even renegotiate or transform the norms themselves. They do this in an intersubjective context with a wide range of interlocutors, both individual and corporate. Finally, thinking about norms in relation to practices eliminates the duality between principled and strategic actions. Practices do not simply echo norms—they make them real. Without the disruptive activity of these actors neither normative change nor change in practices is likely to occur. States and other targets of network activity resist making explicit definitions of "right" and "wrong," and overcoming this resistance is central to network strategies.

This general point about the relationship between norms and practices can be illustrated by a discussion of the changing nature of sovereignty. All of our networks challenge traditional notions of sovereignty. Most views of sovereignty in international relations focus almost exclusively on the understandings and practices of states as the sole determinants of sovereignty, seen as a series of claims about the nature and scope of state authority.^^ Claims about sovereignty are forceful, however, because they represent shared norms, understandings, and expectations that are

constantly reinforced through the practices of states, and by the practices of nonstate actors.

Traditionally, as stated by the World Court, the doctrine of state sovereignty has meant that the state "is subject to no other, and has full and exclusive powers within its jurisdiction." It is a core premise that "how a state behaved toward its own citizens in its own territory was a matter of domestic jurisdiction, i.e., not anyone else's business and therefore not any business for international law." Similarly, how states disposed of the resources within their territories or regulated the development of their economies were at least theoretically sovereign affairs. Much international network activity presumes the contrary: that it is both legitimate and necessary for states or nonstate actors to be concerned about the treatment of the inhabitants of another state. Once granted that cross-border and global environmental problems mean that economic activities within one nation's borders are of legitimate interest to another or others, the frontiers of legitimate interest have been fuzzy—and contested. Transnational advocacy networks seek to redefine these understandings; we ask whether and when they succeed.

Because many of these campaigns challenge traditional notions of state sovereignty, we might expect states to cooperate to block network activities. The ideas that environmental, indigenous, women's and human rights networks bring to the international arena impinge on sovereignty in several ways. First, the underlying logics of the "boomerang" effect and of networks—which imply that a domestic group should reach out to international allies to bring pressure on its government to change its domestic practices—undermine absolute claims to sovereignty. Second, by producing information that contradicts information provided by states, networks imply that states sometimes lie. NGOs often provide more reliable sources of information to international organizations, but by acting on that information, especially when it explicitly contradicts state positions,

79 Alexander Wendt stresses that sovereignty is an institution that exists "only in virtue of certain intersubjective understandings and expectations; there is no sovereignty without an other." He argues that sovereignty norms are now so taken for granted that "it is easy to overlook the extent to which they are both presupposed by and an ongoing artifact of practice." "Anarchy Is What States Make of It," pp. 410-15. Still, even critics of standard views of sovereignty are so concerned with exposing how the discourse of sovereignty is constructed and maintained that they often ignore how conceptions of the state are evolving. See also Richard Ashley, "Untying the Sovereign State: A Double Reading of the Anarchy Problematics," Millennium 17:2 (1988): 227-65.

Organizations of the Book

The case studies that follow, which examine different kinds of advocacy network structures, strategies, and goals, were chosen to highlight the variety of transnational interactions. Chapter 2 asks whether these networks are really a new phenomenon, examining four campaigns that occurred between the 1830s and 1930s. Although not all of them involve transnational networks, all involved transnational actors in the kinds of principled and strategic actions that characterize modern networks. Chapter 3 considers the largest and best-known network, whose practices since the Second World War have promoted changes in norms and institutions around human rights. Comparison of how human rights activists responded to egregious human rights abuses in Argentina during the 1970s and to endemic abuses over the last several decades in Mexico helps to pinpoint the scope, impact, and strategies of the human rights network.
Chapter 4 looks at the development of advocacy networks around third world environmental issues, focusing particularly on the issue of tropical deforestation. It looks at two concrete instances of deforestation, in Rondônia in the Brazilian Amazon and in Sarawak, Malaysia, each of which was inserted into a different global campaign (the multilateral development bank campaign and tropical timber campaign, respectively). In both cases, how the ideas and practices of transnational actors fit into domestic political contexts is key to the analysis. These cases illustrate the difficulty of frame negotiation, where networks bring together actors with different normative and political agendas. Chapter 5 looks at a comparatively new network, the international network on violence against women, and focuses especially on the negotiations of meaning that were part of the network’s emergence. Finally, in the conclusions, we turn to the question of impact: how effective have these networks been in meeting the goals they set for themselves, and what are the effects of their practices in international society?

Chapter 2

Historical Precursors to Modern Transnational Advocacy Networks

When we suggest that transnational advocacy networks have become politically significant forces in international relations over the last several decades, we immediately face a series of challenges. First, where we see links among activists from different nationalities and cultures, others may see cultural imperialism—attempts to impose Western values and culture upon societies that neither desire nor benefit from them. Are “moral” campaigns just thinly disguised efforts by one group to gain its interest and impose its will on another? Next, some question the novelty of these phenomena. After all, internationalism in various forms has been around for a long time. Finally, still others ask about significance—have these campaigns ever produced any important social, political, or cultural changes? On what basis do we attribute such changes to network activists’ work, rather than to deeper structural causes?

A look at history can give us greater purchase on these questions. In this chapter we examine several campaigns that cast light on the work of modern transnational advocacy networks. They include the 1833–65 Anglo-American campaign to end slavery in the United States, the efforts of the international suffrage movement to secure the vote for women between 1888 and 1928, the campaign from 1874 to 1911 by Western missionaries and Chinese reformers to eradicate footbinding in China, and efforts by Western missionaries and British colonial authorities to end the practice of female circumcision among the Kikuyu of Kenya in 1920–31. For each of these campaigns, we pay attention to comparable “noncampaigns” or related issues around which activists did not organize. In the
